

ABSTRACT

The invention provides a method of processing distributable computer readable media in a client/server computer system in a manner specified by a user. The method includes the steps of providing a login construct to a client computer from a server computer. A server computer accepts a login identifier from the client computer that corresponds to the user. The login identifier is used to locate an unprocessed user profile associated with the login identifier in a user profile database when the unprocessed user profile exists. A home networked information monitor is delivered to the client computer in accordance with instructions in a processed user profile. The home networked information monitor is capable of accessing each networked information monitor associated with the login identifier. Each networked information monitor is capable of processing distributable computer readable media.
